

Are Septic Tank Additives Necessary

Avoid using Inorganic & Organic Compounds & Solvents as they can:

- stop the anaerobic digestion process in septic tanks
- harm the bacteria that are essential to the wastewater treatment process
- reduce the effectiveness of conventional septic systems
- kill the bacteria in septic tanks
- impair the performance of secondary treatment systems
- contaminate groundwater

Healthy septic tanks already have enough bacteria to support the biological processes that treat human waste and wastewater.

The best thing you can do for your septic system is to have it properly maintained by a trained professional. That means close inspections and regular septic tank pump-outs.
