

# **Reasons to Install Risers & Lids**

**For most people, your septic system receives little attention until there is an issue. The majority of septic systems are buried underground and you're probably not sure exactly where your tank and its components are located. This can make it difficult to find your access ports, especially if they are buried too. And especially during the winter months when the ground is frozen.**

**Septic tank risers are a cost-effective solution that can provide long-term savings, bringing your access points to grade, so they're no longer buried. A septic tank riser is a large diameter concrete or plastic pipe that runs vertically from the pump-out openings or access ports at the top of a septic tank up to ground level. Risers or "extensions" come in various heights to bring any access port to grade. A lid fits securely on the top of the riser and sits flush with the ground, eliminating digging and searching. Because the riser extends from your tank opening to the lawn surface, it makes accessing your septic tank for pumping, maintenance and inspections much easier.**
